These review questions are for five lecture topics: Organic chemistry, Carbohydrates, Lipids, Proteins, and Nucleic acids. The questions were adapted from several sources, including 1700+ Review Questions for Anatomy and Physiology II (3rd edition) by R. Michael Anson, Ph.D.

Multiple choice review questions:

- 1) Organic molecules always contain _____ atoms
 - A) oxygen
 - B) carbon
 - C) cation
 - D) anion

2) A monosaccharide consists of 7 carbon atoms. How many hydrogen atoms and oxygen atoms does it contain?

- A) 7 hydrogen atoms and 4 oxygen atoms
- B) 2 hydrogen atoms and 1 oxygen atoms
- C) 14 hydrogen atoms and 7 oxygen atoms
- D) None. It is an organic molecule.

3) Which of the following is a polysaccharide?

- A) starch
- B) sucrose
- C) glucose
- D) galactose

4) Which of the following characteristics do all lipid molecules have in common?

- A) They are composed of three six-sided rings and one five-sided ring.
- B) They consist of three fatty acids linked to a glycerol molecule.
- C) They are all hydrophobic.
- D) They are made entirely of carbon, hydrogen, nitrogen, and oxygen.
- 5) A steroid may be best described as a
 - A) highly branched polysaccharide molecule.
 - B) lipid that consists of four fused rings of carbon atoms
 - C) diglyceride attached to a phosphate group and choline.
 - D) polypeptide covalently bonded to a carbohydrate.

6) Although we hear much about the evils of cholesterol, it is actually very important to the human body. Among other things it serves as

- A) a component of cell membranes
- B) the precursor for the formation of blood
- C) a surfactant which aids in digestion of water molecules.
- D) a blood vessel lubricant which aids in blood flow.

7) The monomers of proteins are called _____. They all contain _____ (a type of atom).

- A) Glycerol, Carbon
- B) Glucose, monosaccharides
- C) Polysaccharides, Carbon
- D) Amino acids, Nitrogen

8) In animals, the primary form of carbohydrate storage is

- A) starch.
- B) glycogen.
- C) cellulose.
- D) keratin.

9) Which of the following are functions of proteins in the cell membrane?

- A) transport of substances
- B) making DNA molecules
- C) forming a hydrophobic barrier
- D) detecting molecules outside the cell

Answers to multiple-choice questions:

- 1 = B 2 = C 3 = A 4 = C 5 = B 6 = A 7 = D8 = B
- 9 = A and D

<u>Fill-in-the-blank review questions:</u>

1) Organic molecules all contain _____.

2) Six molecules are shown below (a - f). Which ones are organic molecules?

3) The biological macromolecules are all_____, which means that they are chains of smaller molecules known as _____.

4) Write the names of the four macromolecule types. Following the name of each one, also write the name of its monomer(s) in parenthesis.

5) List all the atoms that carbohydrates are made out of: _____

6) The main function of carbohydrates in the body is _____

7) A _____ is a simple, single-ring sugar; a _____ is formed when two of these link together, and a _____ is formed when many of them link together.

8) Monosaccharides, disaccharides, and polysaccharides all belong to a class of organic molecules known as _____

9) Sugar molecule names are characterized by the suffix (ending letters) _____ (3 letters).

10) Which carbohydrate is our blood sugar? Be as specific as possible and write its molecular formula.

¹¹⁾ A certain monosaccharide molecule has 9 carbons. Write its entire molecular formula:

- 12) In each sentence below, circle the correct word in the parenthesis Table sugar is a (mono/di/poly)saccharide. Table sugar contains (fructose/glycogen/starch) Sugars are (carbohydrates/fats/lipids/proteins)
- 13) List all monosaccharides that are part of...
 - a) Sucrose_____
 - b) Starch _____
 - c) Maltose_____

14) Plants store glucose as a polysaccharide called ______. A very similar polysaccharide, called ______, is the form that glucose is stored as in animal livers and muscles.

15) Name 3 foods that are rich in starch:

16) Starch is to plants, as ______ is to animals.

- 17) Lipids are characterized as being _____ molecules
- 18) There are _____ (a number) major types of lipids.
- 19) Fats and oils are this type of lipid: _____
- 20) List two examples of triglycerides in your body.
- 21) What are the two major functions of triglycerides?
- 22) A triglyceride is a lipid that is made from one _____ molecule joined to three _____ molecules.
- 23) The major type of lipid in cell membranes is _____
- 24) A _____ is formed by replacing one fatty acid in a triglyceride with a phosphorous-containing molecule.
- 25) Phospholipids are made of 3 kinds of smaller "building block" molecules. List all three:

26) Cholesterol is a member of the class of lipids known as _____

27) Write T for true and F for False after each statement about steroids below:
Steroids are lipids ______
Steroids contain glycerol ______
Steroids contain fatty acids ______
Fats are steroids ______
Cholesterol is a steroid

28) How many fused carbon rings do steroids have?

29) After each statement below, write C if it applies to carbohydrates, write L if it applies to lipids, and write B if it applies to both.

Triglycerides are an example. _____ They are used for energy storage. _____ Most of their monomer names end in "ose" (For example, fructose)_____ Cholesterol is an example _____ The molecule $C_4H_8O_4$ is an example. _____

30) Of the four macromolecule types, which is the most abundant in the body?

31) Proteins are made of smaller molecules called _____, joined together in a chain.

32) What type of atom is found in all amino acids but not in carbohydrates?

33) If a protein's name ends in -ase, it probably is a(n) _____ type of protein.

34) If a reaction is carried out by an enzyme, the reactants are called the _____ of the enzyme.

35) Receptors are large molecules found in the membranes of all our cells. Answer the questions below about receptors.

a) Receptors are proteins/carbohydrates/lipids/nucleotides (circle one)

b) What monomers are receptors made out of?_____

36) _____ is a tough, extremely strong fibrous protein.

37) _____ is a type of fibrous protein that, when stretched, snaps back to its original length.

38) After each description below, write the type(s) of protein that match it. Some descriptions may match more than one protein type. Write the names of all matching proteins.

a) It carries out the chemical reactions in our body.

b) It is in the cell membrane.

c) It is most abundant in the tissues that connect bone to bone and muscle to bone.

d) It is abundant in hair.

- e) It binds to other molecules very specifically.
- f) It allows the cell to detect molecules outside the membrane.
- g) It moves molecules through the cell membrane.

39) In the blank space after each protein type on the left, write the letters of all descriptions (a-e) on the right that match it. Some descriptions may match more than one protein type. Write the letters of **all** matching descriptions.

Collegen	a) A fibrous protein
Enzyme	b) Has a crevice to specifically bind molecules
Receptor	c) The material of hair and fingernails
Elastin	d) Carries out chemical reactions
Keratin	e) Detects the presence of molecules outside the cell
Channel protein	f) A channel through the cell membrane

40) The monomers of nucleic acids are _____.

41) The two major types of nucleic acid are _____ and _____.

42) The genetic molecule (the "blueprint") for humans (and other species) is made of _____.

43) ______ are structures that can be seen with a microscope in the nucleus of cells. They are mostly made out are made out of DNA.

44) The primary molecule used inside the cell to supply energy when needed is _____. It is in the molecular family known as ______ (one of the monomers you studied). The energy in this molecule is released when one of its ______ is removed. The molecule is then called ______.

45) Fill in the blanks about nucleic acids:

- a) The genetic molecule is the nucleic acid _____
- b) The other type of nucleic acid (different than the genetic molecule in the previous answer) is
- c) The molecule in cells that directly supplies energy for all cellular processes is _____
- d) When the above molecule has been drained of energy, it becomes another type of molecule known as ______

Answers to fill-in-the-blank review questions:

- 1) Carbon atoms
- 2) A, D, and F
- 3) Polymers
 - Monomers
- 4) Carbohydrates (monosaccharides) Lipids (glycerol and fatty acids) Proteins (amino acids) Nucleic acids (nucleotides)
- 5) Carbon Hydrogen Oxygen
 6) Energy storage
 7) Monosaccharide Disaccharide Polysaccharide
 8) Carbohydrates

9) ose 10) Glucose ($C_6H_{12}O_6$) 11) $C_{9}H_{18}O_{9}$ 12) Disaccharide Fructose Carbohydrates 13) Glucose and Fructose Glucose Glucose 14) Starch Glycogen 15) Potatoes Bread Pasta Rice Corn 16) Glycogen 17) Hydrophobic 18) Three 19) Triglyceride 20) Body fat Skin oils 21) Energy storage Insulation 22) Glycerol Fatty acid 23) Phospholipid 24) Phospholipid 25) Glycerol, fatty acids, and a phosphatecontaining molecule. 26) Steroids 27) Т Т F F F Т 28) Four

29) L В С L С 30) Proteins 31) Amino acids 32) Nitrogen 33) Enzyme 34) Substrates 35) Proteins Amino acids 36) Collagen 37) Elastin 38) (a) Enzymes (b) Receptors and channel proteins (c) Collagen (a fibrous proteins) (d) Keratin (a fibrous protein) (e) Enzymes, Receptors and channel proteins (f) Receptors (g) Channel proteins 39) А BD BE А AC BF 40) Nucleotides 41) DNA **RNA** 42) DNA 43) Chromosomes 44) ATP Nucleotides Phosphates ADP 45) DNA **RNA** ATP ADP

Short answer review questions:

- 1) Describe (or draw) a fatty acid in the space below:
- 2) The symbol below is often used to represent a type of lipid called a ______.

a) Draw a box around the part that contains phosphate ionb) Make a box around the hydrophobic parts

- 3) Draw the backbone of a steroid in the space below:
- 4) What is the function of an enzyme? What is the "active site" of an enzyme?
- 5) Explain briefly the function of a receptor:

6) Explain briefly what makes each receptor specific for only the molecule it is supposed to work with:

7) Compare and contrast the characteristics of collagen, elastin, and keratin.

8) DNA is often called the "genetic molecule" because it controls many of our traits. How exactly does DNA control our traits? In other words, what is its function at the cellular level?

9) The drawing below shows a molecule of ATP, the energy-delivering molecule inside cells. The three black circles are the three phosphate ions that form the "tail" of the ATP molecule. The ATP's structure is changed when it delivers its energy. To the right of the arrow, redraw the molecule *after* it has delivered its energy.

Answers to short answer review questions:

1) A molecule containing a long "tail" of only carbon and hydrogen atoms

4) Enzymes are proteins that carry out all the chemical reactions in the body. The active site of an enzyme is a crevice in the side of the protein where it binds the molecules that it carries out a chemical reaction on.

5) A receptor is a protein found in the cell membrane that can bind to molecules outside the cell. It alerts the cell to the presence of molecules outside the cell binds to molecules outside the cell.

6) Each receptor has a binding site that that is exactly shaped to fit only the molecule it is supposed to detect. Only the one specific molecule can fit into the receptor's binding site.

7) All three molecules are fibrous proteins. Collagen is extremely strong and tough. Elastin is rubber band-like (it can stretch to a long size and then recoil back to its original length). Keratin is a tough plastic-like waterproof protein.

8) DNA contains the instructions for making all the proteins in our body. The proteins made by DNA give us our traits.

9)
